WCET

- 1 WCET problem is generally an **intractable** problem and therefore the **WCET is generally unknown**.
- 2 In its absence any method to derive it must give confidence that its results are close to it. *Underestimation* is normally deemed a more **hazardous** situation whereas a non-overly pessimistic upper-bound is considered ideal.

Measurement-Based or Hybrid Approach

- It collects end-to-end measurements from the actual hardware or an equivalent simulator.
- It is prone to underestimate although it doesn't need to model hardware.
- ☞ *This approach is only applicable if proper test data are supplied to evaluate the performance*

Measurement-Based or Hybrid Approach

- It collects end-to-end measurements from the actual hardware or an equivalent simulator.
- It is prone to underestimate although it doesn't need to model hardware.
- 👉 *This approach is only applicable if proper test data are supplied to evaluate the performance*

Research Question

- 👉 **How do we generate test data for the WCET automatically?**

- Manually generated test data is often the practice in the industry.
- From a certain point of view the WCET can be considered an optimization problem
- Artificial Intelligence offers promising areas to address such a problems: **Meta-heuristics, Constraint-Satisfaction Problems**

Search-Based Testing

```

1  procedure test_foo
2      (x, y : in My_Int)
3      is
4      begin
5
6          if x - y = 0 then
7              Status := Still;
8          end if;
9
10     end test_foo;
  
```

Listing 1: Pathological case of Search-Based Testing

Constraint-Based Testing

- 1 It is able to handle **discrete search space**.
- 2 Industrial Cases of successful application, e.g., SAGE, Microsoft [2].
- 3 NP-hard solving algorithms

What I may offer

- Framework to test new meta-heuristics (test generators) and/or objective functions for a real-world intractable problem with a discrete search space.
- Spark Ada benchmarks for case of study.
- Help with SCIP: An open source constraint solver.
- Help with R environment and application of Statistics of Extremes.

- Spark Ada benchmarks for case of study.
- Help with SCIP: An open source constraint solver.
- Help with R environment and application of Statistics of Extremes.

What I'd be interesting in collaborating with

- Test case generation and other ways of extrapolating Constraint-Based Testing to functional testing. This includes ways of reading formal specifications.
- Test generation for cyber security.
- More sophisticated meta-heuristic application., e.g., hyper-heuristics.
- Ada, C, and C++ Abstract Interpretation and parsing.
